Which external creators should TrueID pilot to test comedy and movie-recap expansion?

MADT 7202 Mid-Term · [Name · Student ID] · Repo: github.com/DecisionLabs-AI/madt7202-web-social-network

1 The decision

Which two external YouTube creators TrueID should bring into a six-week pilot. Owner: Content Partnership Lead.

2 Why a network

A view ranking scores creators one by one. The question is which creators rank in search-intent neighbourhoods adjacent to those where True-owned channels are visible: an overlap only the graph exposes.

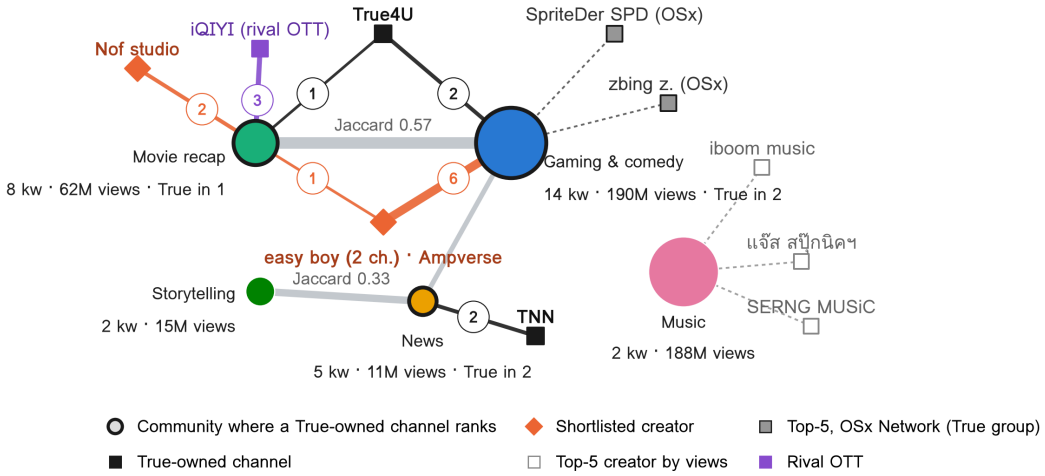

3 Data

Source	YouTube Data API v3 (official, ToS; public metadata only): videos.list (mostPopular, TH) → tags; search.list → top 50 per keyword
Keywords	40 tags used by ≥ 3 channels on TH trending, fixed before results; platform words removed
Corpus	Top 50 per keyword, Thai titles, published 13 Jul – 11 Oct 2026 → 34 keywords, 836 slots
Bias	Search only, not Home/Recommended; one-day ranking (11 Oct) favours new uploads. One source suffices: search placement is what is measured
Group check	Channel descriptions (API, 11 Oct): zbing z., SPD list True Digital/OSx contacts; easy boy lists Ampverse. easy boy and Nof studio treated as external; MCN contracts unobserved

4 Graph construction

Base graph	34 keywords (6 of 40 dropped, < 10 Thai results); 105 edges = ≥ 1 shared top-25 channel
Weighting	Jaccard, not raw count (raw puts generic “สนุก” 2nd, Jaccard 6th); dropping it changes no result
Bridge	Eligible if in ≥ 1 True-visible and ≥ 1 gap keyword; ranked by keywords ↓, True-visible keywords ↓, communities ↓ (easy boy + X2 merged; broadcasters, rival OTTs excluded)
Scenarios	Baseline: True-owned channels only · A: + OSx creators zbing z., SPD as True group

5 The graph

Baseline view; kw = keywords; grey width = summed Jaccard (< 0.1 hidden); coloured lines = top-25 presence (unweighted), number = keywords; scenario A counts OSx creators as True group.

6 Findings

- **A YouTube visibility gap is not a True-group gap.** True-owned channels hold 5 of 836 slots in this one-day sample, but two of the five most-viewed creators (zbing z., SPD) are OSx Network: 77 slots with them.
- **Comedy–movie recap is the bridge that matters** (Jaccard 0.57), anchored by one True4U film.
- **easy boy is the robust comedy–movie-recap bridge; Nof studio is an exploratory movie-recap challenger.** easy boy (7 keywords) stays #1 in Baseline and A under every test: top-10/25/50 windows, ≥ 2–3 videos per edge, any single True result removed; it stays a bridge in 8/8 leave-one-out runs. Nof studio’s bridge status rests on one True4U result for “หนังสนุก” and fails at top 10.

7 Recommended action

- Pilot easy boy (via Ampverse) as the proven bridge and Nof studio as an exploratory movie-recap test for six weeks, e.g. via DOODi by TrueID. Owner: Content Partnership Lead; brief by 31 Oct. If an internal roster shows either is in-group, change the route to activation, not the shortlist.
- Track deep links: new viewers and D7 return vs one top-view creator. Route zbing z. and SPD to OSx activation.

8 What would change my mind

Co-ranking is not a shared audience or a switch to TrueID. In Baseline the bridge rests on one True4U film; only with OSx counted does easy boy survive without it. If the pilots lose to the comparator, I would not sign.
